What is a grid-connected inverter?

The primary function of a grid-connected inverter is to ensure that the AC power produced is synchronized with the grid voltage and frequency, thereby enabling the safe and efficient integration of renewable energy into the grid. The basic functionality of a grid-connected inverter involves several key processes:

What is the control design of a grid connected inverter?

The control design of this type of inverter may be challenging as several algorithms are required to run the inverter. This reference design uses the C2000 microcontroller(MCU) family of devices to implement control of a grid connected inverter with output current control.

How do inverters provide grid services?

In order to provide grid services, inverters need to have sources of power that they can control. This could be either generation, such as a solar panel that is currently producing electricity, or storage, like a battery system that can be used to provide power that was previously stored.

Can a grid connected inverter be left unattended?

Do not leave the design powered when unattended. Grid connected inverters (GCI) are commonly used in applications such as photovoltaic inverters to generate a regulated AC current to feed into the grid. The control design of this type of inverter may be challenging as several algorithms are required to run the inverter.
