According to empirical data, as of recent decades, wind power has accounted for a remarkable fraction of global electricity generation, edging towards around 10% in various regions.

Overview
Wind power capacity and production
Wind energy resources
Wind farms
Economics
Small-scale wind power
Impact on environment and landscape
Politics
In 2024, wind supplied over 2,494 TWh of electricity, which was 8.1% of world electricity. To help meet the Paris Agreement's goals to limit climate change, analysts say it should expand much faster than it currently is - by over 1% of electricity generation per year. Expansion of wind power is being hindered by fossil fuel subsidies

Wind could provide 20% of U.S. electricity by 2030 and 35% by 2050. 11 Five of the eight Great Lakes states have offshore wind energy potentials that exceed their annual electricity demand (MI, WI, NY, ...

Wind turbines currently generate a significant and growing percentage of global electricity, with variations depending on location and turbine technology; on average, a single utility-scale wind ...

Wind power is the nation's largest source of renewable energy, with more than 150 gigawatts of wind energy installed across 42 U.S. States and Puerto Rico. These projects generate ...

According to the U.S. Department of Energy, wind turbines start producing electricity at wind speeds of around 6 mph and reach peak output at about 30-55 mph. Beyond this speed range, ...

In an ideal world, a turbine would convert 100 percent of wind passing through the blades into power. Because of factors such as friction, these machines only have efficiency ratings of ...

In 2022, wind turbines were the source of about 10.3% of total U.S. utility-scale electricity generation. Utility scale includes facilities with at least one megawatt (1,000 kilowatts) of electricity ...

Large wind turbines can generate between 1 to 8 megawatts of electricity, enough to power around 1, 500

How much wind can generate electricity

average households. Most onshore wind turbines have a capacity of 2-3 ...

Modern wind turbines can generate electricity at wind speeds as low as six to nine miles per hour. This is known as the cut-in speed. If wind speeds exceed 55 miles per hour, the turbines shut off to ...

Wind power is thus proportional to the third power of the wind speed; the available power increases eightfold when the wind speed doubles. Change of wind speed by a factor of 2.1544 increases the ...
