How does a solar inverter dongle work?

Specifies the derating value of the solar inverter active power by percentage. If the Dongle does not detect any power meter data or the communication between the Dongle and the solar inverter is disconnected, the Dongle delivers the derating value of the solar inverter active power by percentage.

What is solar inverter export limitation?

In the solar inverter export limitation scenario, if this parameter is set to Enable, the solar inverter will derate according to the active power derating percentage when the communication between the solar inverter and the Dongle is disconnected for a period longer than Communication disconnection detection time.

How do I set power parameters?

On the home screen, tap Power Adjustment and set power parameters as required. The UI is for reference only. The UI varies with associated devices. The actual UI prevails. The parameter list provided in this document includes all configurable parameters that vary with the device model and grid code. The actual screen prevails.

How do I set the peak power range?

Set the peak power range based on the start time and end time. The peak power is configured based on electricity prices in different time segments. You are advised to set the peak power to a low value when the electricity price is high. A maximum of 14 time segments are allowed.
